

# Announcement

ITIS 6200 / 8200

- Project #1 due today
- Assignment #3 release today
  - To be released at 11:59am
  - Due Nov.9 11:59pm
- Project #2 to be released next Thursday
  - To be released at Nov.2 11:59am
  - Due Nov.16 11:59pm

# Intro to Networking and ARP

# Today: Intro to Networking

ITIS 6200 / 8200

- Internet: A global network of computers
- OSI model: A layered model of protocols

# What's the Internet?

# What's the Internet?

ITIS 6200 / 8200

- **Network:** A set of connected machines that can communicate with each other
  - Machines on the network agree on a **protocol**, a set of rules for communication
- **Internet:** A global network of computers
  - The web sends data between browsers and servers using the Internet
  - The Internet can be used for more than the web (e.g. SSH)

# Protocols

ITIS 6200 / 8200

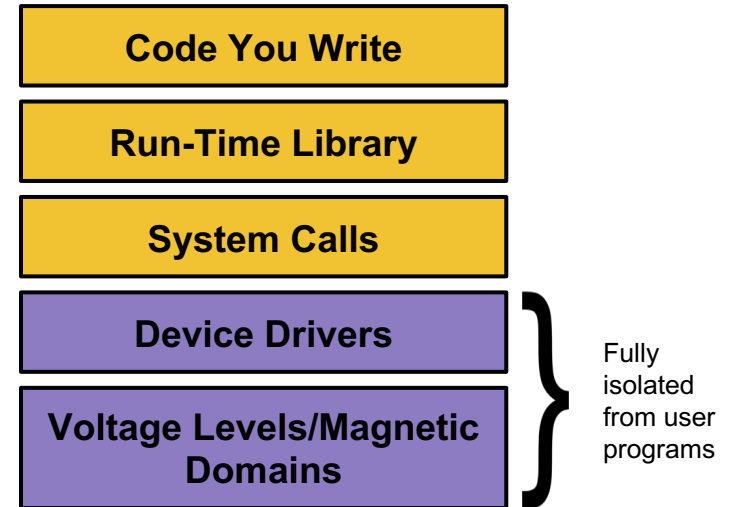

- A **protocol** is an agreement on how to communicate that specifies syntax and semantics
  - *Syntax*: How a communication is specified and structured (format, order of messages)
  - *Semantics*: What a communication means (actions taken when sending/receiving messages)
- Example: Protocol for asking a question in lecture?
  1. The student should raise their hand
  2. The student should wait to be called on by the speaker or wait for the speaker to pause
  3. The student should speak the question after being called on or after waiting

# Layering: The OSI Model

# Layering

ITIS 6200 / 8200

- Internet design is partitioned into various layers. Each layer...
  - Has a protocol
  - Relies on services provided by the layer below it
  - Provides services to the layer above it
- Analogous to the structure of an application and the “services” that each layer relies on and provides

# Example: Sending Mail

ITIS 6200 / 8200

Alice

I am hungry.

Bob

# Example: Sending Mail

ITIS 6200 / 8200

Alice

Send to: Bob

I am hungry.

Bob

# Example: Sending Mail

ITIS 6200 / 8200

Alice

Mail to: 123 Bob St

Send to: Bob

I am hungry.

Bob

# Example: Sending Mail

ITIS 6200 / 8200

Alice

Bob

Mail to: 123 Bob St

Send to: Bob

I am hungry.

# Example: Sending Mail

ITIS 6200 / 8200

Alice

Bob

Send to: Bob

I am hungry.

# Example: Sending Mail

ITIS 6200 / 8200

Alice

Bob

I am hungry.

# Example: Sending Mail

ITIS 6200 / 8200

Each layer communicates with each other, relying on abstractions below them!

Alice

Bob

**Relies upon:**  
Sending messages to people

**Provides:** Sending messages to people  
**Relies upon:**  
Sending messages to addresses

**Provides:** Sending messages to addresses

# OSI Model

ITIS 6200 / 8200

- **OSI model:** Open Systems Interconnection model, a layered model of Internet communication
  - Originally divided into 7 layers
    - But layers 5 and 6 aren't used in the real world, so we ignore them
    - And we'll talk about layer 4.5 for encryption later
- Same reliance upon abstraction
  - A layer can be implemented in different ways without affecting other layers
  - A layer's protocol can be substituted with another protocol without affecting other layers

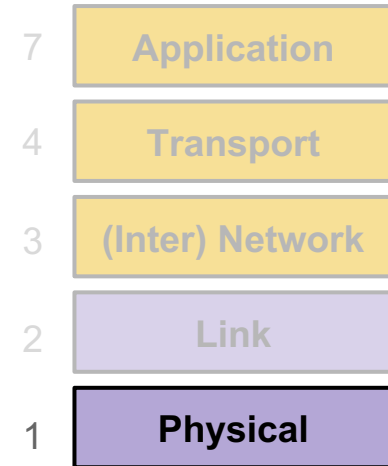

# Layer 1: Physical Layer

ITIS 6200 / 8200

- **Provides:** Sending bits from one device to another
  - Encodes bits to send them over a physical link
    - Patterns of voltage levels
    - Photon intensities
    - RF modulation
- **Examples**
  - Wi-Fi radios (IEEE 802.11)
  - Ethernet voltages (IEEE 802.3)

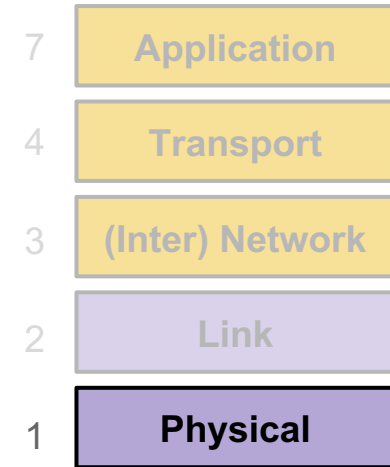

# Layer 1: Physical Layer

ITIS 6200 / 8200

Physical layer: “How do I transmit this sequence of 0’s and 1’s from A to B?”

Next: How do we talk to more than one device?

# Layer 2: Link Layer

ITIS 6200 / 8200

- **Provides:** Sending frames directly from one device to another
  - **Relies upon:** Sending bits from one device to another
  - Encodes messages into groups of bits called “frames”
- **Examples**
  - Ethernet frames (IEEE 802.3)

# Layer 2: Link Layer

ITIS 6200 / 8200

- **Local area network (LAN):** A set of computers on a shared network that can directly address one another
  - Consists of multiple physical links
- Frames must consist of at least 3 things:
  - Source ("Who is this message coming from?")
  - Destination ("Who is this message going to?")
  - Data ("What does this message say?")

# Layer 2: Link Layer

ITIS 6200 / 8200

- In reality, computers aren't all connected to the same wire
  - Instead, local networks are a set of point-to-point links
- However, Layer 2 still allows direct addressing between any two devices
  - Enabled by transmitting a frame across multiple physical links until it reaches its destination
  - Provides an **abstraction** of a “everything is connected to one wire”

# Ethernet and MAC Addresses

ITIS 6200 / 8200

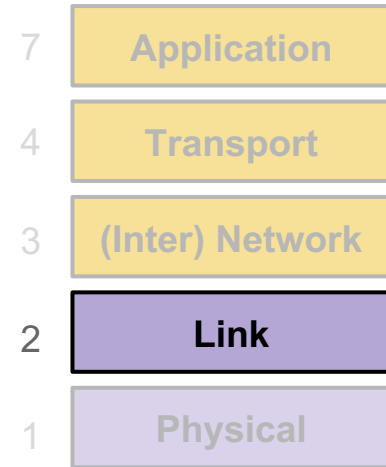

- **Ethernet:** A common layer 2 protocol that most endpoint devices use
- **MAC address:** A 6-byte address that identifies a piece of network equipment (e.g. your phone's Wi-Fi controller)
  - Stands for **Media Access Control**, not message authentication code
  - Typically represented as 6 hex bytes: **13:37:ca:fe:f0:0d**
  - The first 3 bytes are assigned to manufacturers (i.e. who made the equipment)
    - This is useful in identifying a device
  - The last 3 bytes are device-specific

# Layer 2: Link Layer

ITIS 6200 / 8200

Link layer: “How do I transmit this frame from A to C, making sure that no one else thinks the message is for them?”

Source: A  
Dest: C  
“Hello, this is A...”

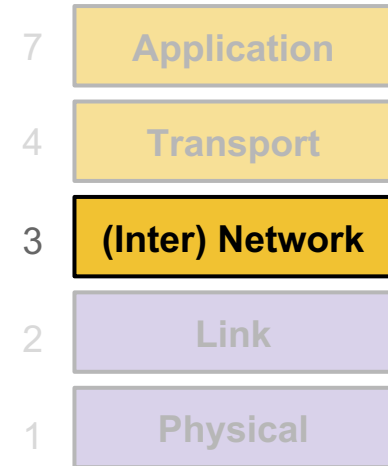

Next: How do we address every device in existence?

# Layer 3: Network Layer

ITIS 6200 / 8200

- **Provides:** Sending packets from any device to any other device
  - **Relies upon:** Sending frames directly from one device to another
  - Encodes messages into groups of bits called “packets”
  - Bridges multiple LANs to provide global addressing
- **Examples**
  - Internet Protocol (IP)

# Layer 3: Network Layer

ITIS 6200 / 8200

- Recall the ideal layer 2 model: All devices can directly address all other devices
  - This would not scale to the size of the Internet!
- Instead, allow packets to be **routed** across different devices to reach the destination
  - Each hop is allowed to use its own physical and link layers!
- Basic model:
  - Is the destination of the packet directly connected to my LAN?
    - Pass it off to Layer 2
  - Otherwise, **route** the packet closer to the destination

# Layer 3: Network Layer

ITIS 6200 / 8200

# Layer 3: Network Layer

ITIS 6200 / 8200

- Packets must consist of at least 3 things:
  - Source (“Who is this message coming from?”)
  - Destination (“Who is this message going to?”)
  - Data (“What does this message say?”)
  - Similar to frames (layer 2)
- Packets may be fragmented into smaller packets
  - Different links might support different maximum packet sizes
  - Up to the recipient to reassemble fragments into the original packet
  - In IPv4, any node may fragment a packet if it is too large to route
  - In IPv6, the sender must fragment the packet themselves
- Each router forwards a given packet to the next hop
- Packets are not guaranteed to take a given route
  - Two packets with the same source and destination may take different routes

# Internet Protocol (IP)

ITIS 6200 / 8200

- **Internet Protocol (IP):** The universal layer-3 protocol that all devices use to transmit data over the Internet
- **IP address:** An address that identifies a device on the Internet
  - IPv4 is 32 bits, typically written as 4 decimal octets, e.g. **35.163.72.93**
  - IPv6 is 128 bits, typically written as 8 groups of 2 hex bytes: **2607:f140:8801::1:23**
    - If digits or groups are missing, fill with 0's, so  
**2607:f140:8801:0000:0000:0000:0001:0023**
  - Globally unique from any single perspective
    - For now, you can think of them as just being globally unique
  - IP addresses help nodes make decisions on where to forward the packet

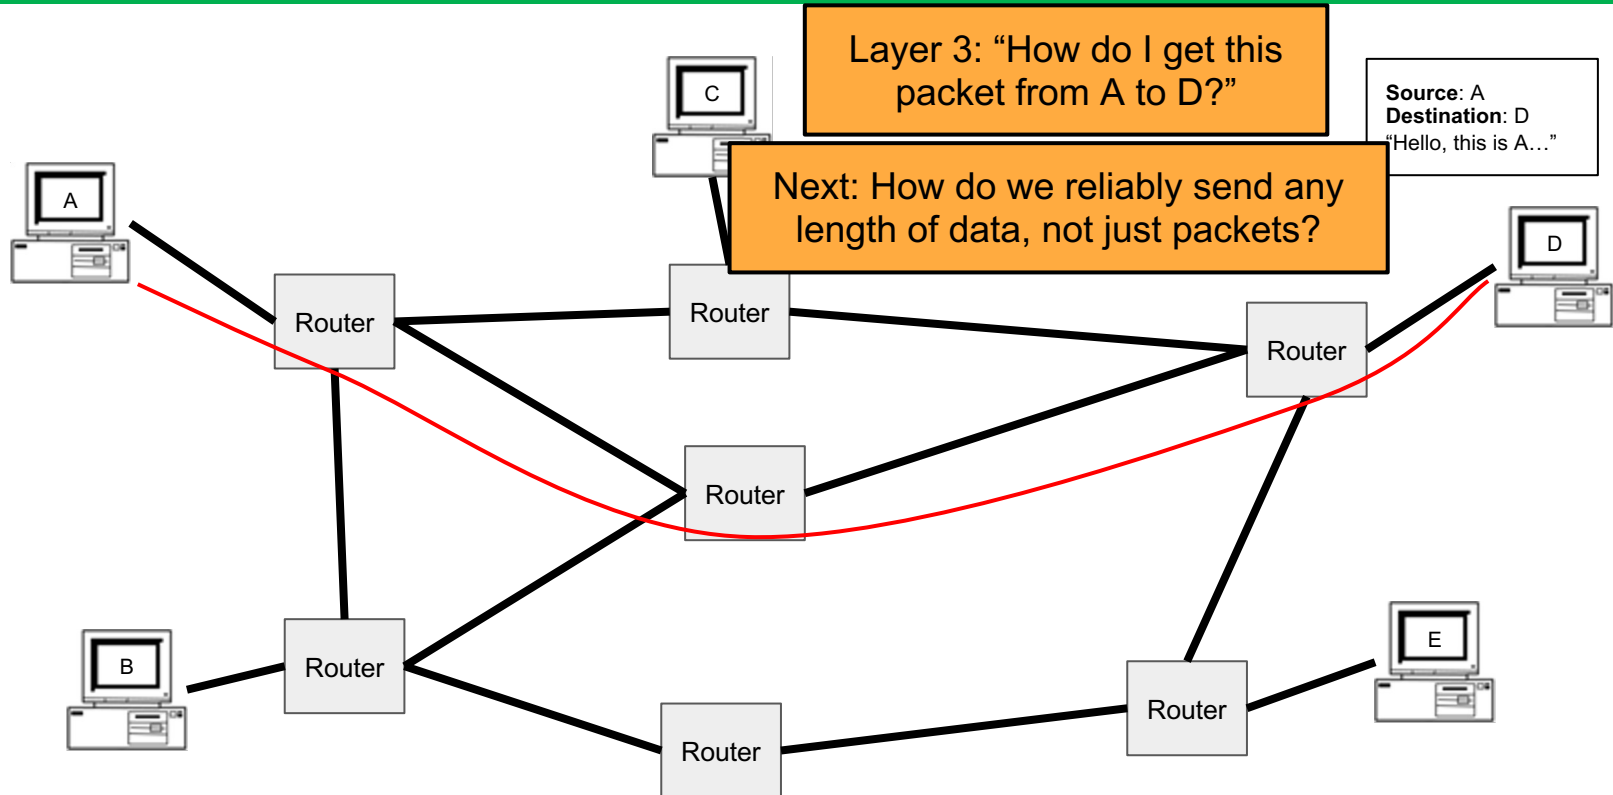

# Reliability

ITIS 6200 / 8200

- **Reliability** ensures that packets are received correctly or, if random errors occur, not at all
  - This is implemented with a checksum
  - However, there is no cryptographic MAC, so there are no guarantees if an attacker modifies packets
- IP is **unreliable** and only provides a **best effort** delivery service, which means:
  - Packets may be lost (“dropped”)
  - Packets may be corrupted
  - Packets may be delivered out of order
- It is up to higher level protocols to ensure that the connection is reliable

# Layer 3: Network Layer

ITIS 6200 / 8200

# Layer 4: Transport Layer

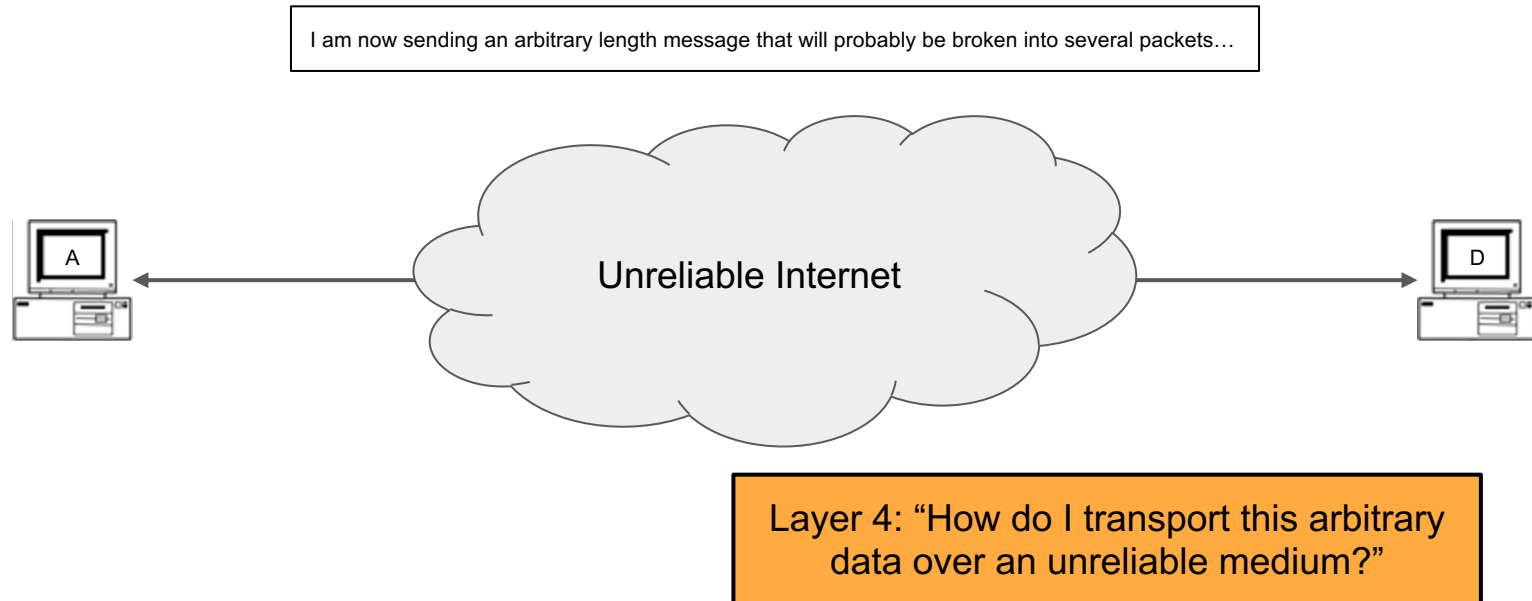

ITIS 6200 / 8200

- **Provides:** Transportation of variable-length data from any point to any other point
  - **Relies upon:** Sending packets from any device to any other device
  - Builds abstractions that are useful to applications on top of layer 3 packets
- Useful abstractions
  - **Reliability:** Transmit data reliably, in order
  - **Ports:** Provide multiple “addresses” per real IP address
- Examples
  - **TCP:** Provides reliability and ports
  - **UDP:** Provides ports, but no reliability

# Layer 4: Transport Layer

ITIS 6200 / 8200

# Layer 7: Application Layer

ITIS 6200 / 8200

- **Provides:** Applications and services to users!
  - **Relies upon:** Transportation of variable-length data from any point to any other point
- Every online application is Layer 7
  - Web browsing
  - Online video games
  - Messaging services
  - Video calls (Zoom)

# Layers of Abstraction and Headers

ITIS 6200 / 8200

- As you move to lower layers, you wrap additional headers around the message
- As you move to higher layers, you peel off headers around the message
- When sending a message we go from the highest to the lowest layer
- When receiving a message we go from the lowest to highest layer

# Example: HTTP Request

ITIS 6200 / 8200

# Summary: Intro to Networking

ITIS 6200 / 8200

- Internet: A global network of computers
  - Protocols: Agreed-upon systems of communication
- OSI model: A layered model of protocols
  - Layer 1: Communication of bits
  - Layer 2: Local frame delivery
    - Ethernet: The most common Layer 2 protocol
    - MAC addresses: 6-byte addressing system used by Ethernet
  - Layer 3: Global packet delivery
    - IP: The universal Layer 3 protocol
    - IP addresses: 4-byte (or 16-byte) addressing system used by IP
  - Layer 4: Transport of data
  - Layer 7: Applications and services
